Invasive Plants in Pennsylvania

Yellow Flag Iris

*Iris pseudacorus L.*

**Description:**
An herbaceous perennial that grows to a height of three to four feet. The leaves grow to a length of one to three feet and are green with a grayish-blue tint. Flowers are usually yellow, although they may also be cream-colored.

**Biology and Spread:**
Each fruit capsule contains roughly 120 seeds (top image) that are buoyant and can float long distances in water. The plant can also spread vegetatively through pieces of its rhizome/roots (bottom image).

**Habitat:**
This plant can survive a wide range of conditions, from fresh to brackish water and even low oxygen habitats. Wetlands, stream banks, ponds and ditches are places you may see this plant. Yellow iris tolerates high soil acidity and needs high levels of nitrogen for optimum growth.

**Ecological Threat:**
Widely planted as a pond ornamental in the past, this plant has escaped cultivation. It can form dense colonies in fresh or brackish water, altering habitat and displacing native plant and animal species. All parts of the plant are poisonous.
**How to Control this Species:**

<table>

<th>Manual</th>
<th>Chemical</th>
</tr>
</thead>
<tbody>
<tr>
<td>Be careful when removing by hand: resin from the leaves and roots of this plant can cause skin irritation. At a minimum, remove seed pods and flowers to help slow this plant’s spread. Small infestations can be dug up but the entire rhizome system must be removed or the plants will return. Limit soil disturbance as much as possible.</td>
<td>For most large-scale infestations, some form of herbicide will be needed. Several readily available herbicides can be effectively used to treat this plant, including a glyphosate that is labeled for use in wetland habitats. Because of the extensive root system, multiple applications of herbicide over multiple years will probably be needed for eradication. Always follow all of the herbicide label’s instructions and state requirements.</td>
